### Abstract :

Now-a-days, adulteration in spices is very common. In particular, adulterated turmeric powder may have mentanil yellow, lead chromate, etc. However, chilly powder may contain adulterants such as Sudan dyes, Rhodamine B, etc. On the other hand, in the markets, apples are made attractive by polishing them with various types of waxes such as beeswax, petroleum jelly etc. Adulteration is primarily intended for economic gains. However, a prolonged consumption of adulterated food may lead to serious health risks.

In this study, we have utilized Surface Enhanced Raman Scattering (SERS) technique for detection of these hazardous dyes in spices and polished waxes on apples. A SERS substrate is fabricated using nanoscale silicon ripples (R-Si) (wavelength = 30 nm) by low energy ion-beam bombardment followed by the deposition of highly ordered Ag-nanoparticles (Ag-NPs) along these ripple patterns. Different concentrations of dyes (starting from 10<sup>-2</sup>M to 10<sup>-9</sup>M) are mixed with saturated solutions of turmeric and chilly powders and their presence is probed using Ag-NPs/R-Si SERS substrates. It is observed that an ultralow concentration of these adulterant dyes can be detected using these SERS substrates [1-3]. This study paves a way toward improving the efficacy of adulterants detection in foods.
